# Chapter 1

## Class Index

### 1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">AccountRecord</a> . . . . .	5
<a href="#">BSTree&lt; DataType, KeyType &gt;</a> . . . . .	5
<a href="#">BSTree&lt; DataType, KeyType &gt;::BSTreeNode</a> . . . . .	15
<a href="#">IndexEntry</a> . . . . .	16
<a href="#">TestData</a> . . . . .	17

## Chapter 2

# File Index

### 2.1 File List

Here is a list of all files with brief descriptions:

<a href="#">BSTree.cpp</a>	19
<a href="#">BSTree.h</a>	19
<a href="#">config.h</a>	19
<a href="#">database.cpp</a>	20
<a href="#">test9.cpp</a>	21

## Chapter 3

# Class Documentation

### 3.1 AccountRecord Struct Reference

#### Public Attributes

- int [acctID](#)
- char [firstName](#) [[nameLength](#)]
- char [lastName](#) [[nameLength](#)]
- double [balance](#)

#### 3.1.1 Member Data Documentation

3.1.1.1 int AccountRecord::acctID

3.1.1.2 double AccountRecord::balance

3.1.1.3 char AccountRecord::firstName[nameLength]

3.1.1.4 char AccountRecord::lastName[nameLength]

The documentation for this struct was generated from the following file:

- [database.cpp](#)

### 3.2 BSTree< DataType, KeyType > Class Template Reference

```
#include <BSTree.h>
```

## Classes

- class [BSTreeNode](#)

## Public Member Functions

- [BSTree](#) ()
- [BSTree](#) (const [BSTree](#)< DataType, KeyType > &other)
- [BSTree](#) & [operator=](#) (const [BSTree](#)< DataType, KeyType > &other)
- [~BSTree](#) ()
- void [insert](#) (const DataType &newDataItem)
- bool [retrieve](#) (const KeyType &searchKey, DataType &searchDataItem) const
- bool [remove](#) (const KeyType &deleteKey)
- void [writeKeys](#) () const
- void [clear](#) ()
- bool [isEmpty](#) () const
- void [showStructure](#) () const
- int [getHeight](#) () const
- int [getCount](#) () const

## Protected Member Functions

- void [showHelper](#) ([BSTreeNode](#) \*p, int level) const
- void [insertHelper](#) ([BSTreeNode](#) \*&ptr, const DataType &newDataItem)
- bool [removeHelper](#) ([BSTreeNode](#) \*&ptr, const KeyType &deleteKey)
- bool [retrieveHelper](#) ([BSTreeNode](#) \*ptr, const KeyType &searchKey, DataType &searchDataItem) const
- void [clearHelper](#) ([BSTreeNode](#) \*&ptr)
- void [writeKeysHelper](#) ([BSTreeNode](#) \*ptr) const
- void [copyHelper](#) ([BSTreeNode](#) \*&ptr, [BSTreeNode](#) \*sourcePtr)
- int [getHeightHelper](#) ([BSTreeNode](#) \*ptr) const
- int [getCountHelper](#) ([BSTreeNode](#) \*ptr) const

## Protected Attributes

- [BSTreeNode](#) \* [root](#)

```
template<typename DataType, class KeyType> class BSTree< DataType, KeyType >
```

### 3.2.1 Constructor & Destructor Documentation

```
3.2.1.1 template<typename DataType , typename KeyType > BSTree< DataType, KeyType
>::BSTree ( )
```

default constructor

Creates an empty binary search tree. set root to null

3.2.1.2 `template<typename DataType , typename KeyType > BSTree< DataType, KeyType  
>::BSTree ( const BSTree< DataType, KeyType > & other )`

copy constructor

Initializes the binary search tree to be equivalent to the other [BSTree](#) object parameter.

#### Parameters

<i>other</i>	reference to a BST to be copied from
--------------	--------------------------------------

set root to null

use copy helper to set values

3.2.1.3 `template<typename DataType , typename KeyType > BSTree< DataType, KeyType  
>::~~BSTree ( )`

destructor

Deallocates (frees) the memory used to store the binary search tree. clear values

## 3.2.2 Member Function Documentation

3.2.2.1 `template<typename DataType , typename KeyType > void BSTree< DataType,  
KeyType >::clear ( )`

clear

Removes all data items in the binary search tree

3.2.2.2 `template<typename DataType , typename KeyType > void BSTree< DataType,  
KeyType >::clearHelper ( BSTreeNode *& ptr ) [protected]`

clearHelper

Recursive helper for clear. Ends if at null pointer. Else, calls to remove children and deletes itself. Calls itself to remove all data items in the binary search tree

#### Parameters

<i>ptr</i>	<a href="#">BSTreeNode</a> pointer to current node
------------	--

if pointer is null

if data has children

clear left and right children

delete root

set to null

3.2.2.3 `template<typename DataType , typename KeyType > void BSTree< DataType, KeyType >::copyHelper ( BSTreeNode * & ptr, BSTreeNode * sourcePtr )`  
`[protected]`

copyHelper

Sets this BS tree to be equivalent to the other [BSTree](#) parameter by calling itself to copy each node

Parameters

<i>ptr</i>	<a href="#">BSTreeNode</a> pointer to current node to copy to
<i>sourcePtr</i>	<a href="#">BSTreeNode</a> pointer to source's node to copy from

if node empty, end

copy value in source node

copy left and right values

3.2.2.4 `template<typename DataType , typename KeyType > int BSTree< DataType, KeyType >::getCount ( ) const`

getCount

Returns the count of the number of data items in the binary search tree.

Returns

int count of number of data items in BST

call helper to count data items

3.2.2.5 `template<typename DataType , typename KeyType > int BSTree< DataType, KeyType >::getCountHelper ( BSTreeNode * ptr ) const` `[protected]`

getCountHelper

Returns the count of number of data items in the BST

Parameters

<i>ptr</i>	<a href="#">BSTreeNode</a> pointer to current node to copy to
------------	---

Returns

int count of items in BST

base case - end of branch

recursive call - add 1 (this item) plus counts of left and right branches

3.2.2.6 `template<typename DataType , typename KeyType > int BSTree< DataType, KeyType >::getHeight ( ) const`

getHeight

Returns the height of the binary search tree.

Returns

int height of BST

call helper to count height

3.2.2.7 `template<typename DataType , typename KeyType > int BSTree< DataType, KeyType >::getHeightHelper ( BSTreeNode * ptr ) const [protected]`

getHeightHelper

Returns the height of the BST

Parameters

<i>ptr</i>	BSTreeNode pointer to current node to copy to
------------	---

Returns

int height of BST

base case - end of branch

if left branch has greater height than right

return 1 (for this node) plus the height of left branch

otherwise

return 1 (for this node) plus the height of right branch

3.2.2.8 `template<typename DataType , typename KeyType > void BSTree< DataType, KeyType >::insert ( const DataType & newDataItem )`

insert

Calls insertHelper to insert a new data item into BST. Inserts new data item into the BST. If a data item with the same key as newDataItem already exists in the tree, then updates that data item with newDataItem.

Parameters

<i>newDataItem</i>	reference to the data to be inserted
--------------------	--------------------------------------

3.2.2.9 `template<typename DataType , typename KeyType > void BSTree< DataType, KeyType >::insertHelper ( BSTreeNode *& ptr, const DataType & newDataItem )`  
`[protected]`

insertHelper

Recursive helper for insert. Inserts new data item into the BST. If a data item with the same key as newDataItem already exists in the tree, then updates that data item with newDataItem. Calls itself if data should go to right or left until a null is found.

Parameters

<i>ptr</i>	<a href="#">BSTreeNode</a> pointer to current node
<i>newDataItem</i>	int value to be inserted

if current tree node is null

insert a new node with given data

if data to be inserted is less than current tree node

call insertHelper with node to the right

if data to be inserted is greater than current node

call insertHelper with node to the right

3.2.2.10 `template<typename DataType , typename KeyType > bool BSTree< DataType, KeyType >::isEmpty ( ) const`

isEmpty

Returns true if the BST is empty. Otherwise, returns false.

Returns

bool if tree is empty or not

return true if root is null, false otherwise

3.2.2.11 `template<typename DataType , typename KeyType > BSTree< DataType, KeyType > & BSTree< DataType, KeyType >::operator= ( const BSTree< DataType, KeyType > & other )`

assignment operator

Sets the BS tree to be equivalent to the other [BSTree](#) parameter and returns a reference to this object.

Parameters

<i>other</i>	reference to a BS tree to be copied from
--------------	--

**Returns**

[BSTree](#)& reference to this BS tree

if not same expression trees

clear values

copy values using copy helper

return this expression tree, dereferenced

**3.2.2.12** `template<typename DataType , typename KeyType > bool BSTree< DataType, KeyType >::remove ( const KeyType & deleteKey )`

**remove**

Calls removeHelper to delete the key passed. Deletes the data item with key deleteKey from the binary search tree. If the data item is found, then deletes it from the tree and returns true. Otherwise, returns false.

**Parameters**

<i>deleteKey</i>	a reference to the key to delete
------------------	----------------------------------

**Returns**

bool true if data was found and removed, false otherwise

**3.2.2.13** `template<typename DataType , typename KeyType > bool BSTree< DataType, KeyType >::removeHelper ( BSTreeNode *& ptr, const KeyType & deleteKey )`  
[protected]

**removeHelper**

Recursive helper for remove. Calls itself to delete the key passed. Deletes the data item with key deleteKey from the binary search tree. If the data item is found, then deletes it from the tree and returns true. Otherwise, returns false.

**Parameters**

<i>ptr</i>	<a href="#">BSTreeNode</a> pointer to current node
<i>deleteKey</i>	int value to be deleted

if ptr is null

value was not found

if value was found

case 1 - no children

delete node

```

set ptr to null
return that data was deleted
case 2 - 1 child
case 2l - left child
initialize temp node pointer
point temp to ptr
point ptr to its left child
delete temp (original ptr)
return that data was deleted
case 2r - right child
initialize temp node pointer
point temp to ptr
change ptr to its right child
delete temp (original ptr)
return that data was deleted
case 3 - 2 children
initialize a temp note pointer
set the temp pointer to ptr
point temp to its left child
until temp equals null
point temp to its right child
set ptr's data to that of temp's ( change the value of the removed node to that of it's
closest child )
call removeHelper to repeat on remaining children and return result
if the ptr's data is greater than the one to delete
call removeHelper to test child to left
if the ptr's data is less than the one to delete
call removeHelper to test child to right

```

```

3.2.2.14  template<typename DataType , typename KeyType > bool BSTree< DataType,
           KeyType >::retrieve ( const KeyType & searchKey, DataType & searchDataItem )
           const

```

retrieve

Calls retrieveHelper to find the data item passed. Searches the BST for the data item with key searchKey. If this data item is found, then copies the data item to searchData-

Item and returns true. Otherwise, returns false and searchDataItem undefined.

#### Parameters

<i>searchKey</i>	a reference to the key searching for
<i>searchDataItem</i>	a reference to the data value to find

#### Returns

bool if value was found

```
3.2.2.15  template<typename DataType , typename KeyType > bool BSTree< DataType,
          KeyType >::retrieveHelper ( BSTreeNode * ptr, const KeyType & searchKey,
          DataType & searchDataItem ) const    [protected]
```

#### retrieveHelper

Recursive helper for retrieve. Calls itself to find the data item passed. Searches the BST for the data item with key searchKey. If this data item is found, then copies the data item to searchDataItem and returns true. Otherwise, returns false and searchDataItem undefined.

#### Parameters

<i>ptr</i>	BSTreeNode pointer to current node
<i>deleteKey</i>	int value to be deleted

#### base cases

if current node is null

value was not found, return false

if search data item is found

set search data item, return true

recursive calls

if search item is less than pointer's

call self with node to the left

if search item is greater than pointer's

call self with node to the right

```
3.2.2.16  template<typename DataType , typename KeyType > void BSTree< DataType,
          KeyType >::showHelper ( BSTreeNode * p, int level ) const    [protected]
```

#### showHelper

Recursive helper for showStructure. Outputs the subtree whose root node is pointed to

by p. Parameter level is the level of this node within the tree.

#### Parameters

<i>p</i>	pointer to current node
<i>level</i>	int count of number of levels currently

Loop counter

Output right subtree

Tab over to level

Output key

Output "connector"

Output left subtree

**3.2.2.17** `template<typename DataType , typename KeyType > void BSTree< DataType, KeyType >::showStructure ( ) const`

showStructure

Outputs the keys in a binary search tree. The tree is output rotated counterclockwise 90 degrees from its conventional orientation using a "reverse" inorder traversal. This operation is intended for testing and debugging purposes only.

**3.2.2.18** `template<typename DataType , typename KeyType > void BSTree< DataType, KeyType >::writeKeys ( ) const`

writeKeys

Outputs the keys of the data items in the BST. The keys are output in ascending order on one line, seperated by spaces.

**3.2.2.19** `template<typename DataType , typename KeyType > void BSTree< DataType, KeyType >::writeKeysHelper ( BSTreeNode * ptr ) const [protected]`

writeKeysHelper

Recursive helper for writeKeys. Outputs the keys of the data items in the BST. The keys are output in ascending order on one line, seperated by spaces.

#### Parameters

<i>ptr</i>	<a href="#">BSTreeNode</a> pointer to current node
------------	--

for each node that isn't empty

print nodes to left

print this node

print nodes to right

### 3.2.3 Member Data Documentation

3.2.3.1 `template<typename DataType, class KeyType> BSTreeNode* BSTree< DataType, KeyType >::root` [protected]

The documentation for this class was generated from the following files:

- [BSTree.h](#)
- [BSTree.cpp](#)

## 3.3 BSTree< DataType, KeyType >::BSTreeNode Class Reference

```
#include <BSTree.h>
```

### Public Member Functions

- [BSTreeNode](#) (const DataType &nodeDataItem, [BSTreeNode](#) \*leftPtr, [BSTreeNode](#) \*rightPtr)

### Public Attributes

- DataType [dataItem](#)
- [BSTreeNode](#) \* [left](#)
- [BSTreeNode](#) \* [right](#)

```
template<typename DataType, class KeyType> class BSTree< DataType, KeyType >::BSTreeNode
```

### 3.3.1 Constructor & Destructor Documentation

3.3.1.1 `template<typename DataType , typename KeyType > BSTree< DataType, KeyType >::BSTreeNode::BSTreeNode ( const DataType & nodeDataItem, BSTreeNode * leftPtr, BSTreeNode * rightPtr )`

constructor

Creates a binary search tree node

#### Parameters

<i>nodeDataItem</i>	reference to data to save to node
<i>leftPtr</i>	pointer to node to the left
<i>rightPtr</i>	pointer to node to the right

initialize data members

### 3.3.2 Member Data Documentation

3.3.2.1 `template<typename DataType, class KeyType> DataType BSTree< DataType, KeyType >::BSTreeNode::dataItem`

3.3.2.2 `template<typename DataType, class KeyType> BSTreeNode* BSTree< DataType, KeyType >::BSTreeNode::left`

3.3.2.3 `template<typename DataType, class KeyType> BSTreeNode * BSTree< DataType, KeyType >::BSTreeNode::right`

The documentation for this class was generated from the following files:

- [BSTree.h](#)
- [BSTree.cpp](#)

## 3.4 IndexEntry Struct Reference

### Public Member Functions

- `int getKey () const`
- `void setKey (int key)`

### Public Attributes

- `int acctID`
- `long recNum`

### 3.4.1 Member Function Documentation

3.4.1.1 `int IndexEntry::getKey ( ) const` `[inline]`

3.4.1.2 `void IndexEntry::setKey ( int key )` `[inline]`

### 3.4.2 Member Data Documentation

3.4.2.1 `int IndexEntry::acctID`

3.4.2.2 `long IndexEntry::recNum`

The documentation for this struct was generated from the following file:

- [database.cpp](#)

## 3.5 TestData Class Reference

### Public Member Functions

- void [setKey](#) (int newKey)
- int [getKey](#) () const

### Private Attributes

- int [keyField](#)

### 3.5.1 Member Function Documentation

3.5.1.1 int `TestData::getKey ( ) const` `[inline]`

3.5.1.2 void `TestData::setKey ( int newKey )` `[inline]`

### 3.5.2 Member Data Documentation

3.5.2.1 int `TestData::keyField` `[private]`

The documentation for this class was generated from the following file:

- [test9.cpp](#)

## Chapter 4

# File Documentation

### 4.1 BSTree.cpp File Reference

```
#include <stdexcept>  #include <iostream>  #include "BSTree.h"
```

#### 4.1.1 Detailed Description

**Author**

CatherinePollock

**Date**

10/16/14

This is the implementation file for the [BSTree.h](#) file.

### 4.2 BSTree.h File Reference

```
#include <stdexcept> #include <iostream>
```

**Classes**

- class [BSTree< DataType, KeyType >](#)
- class [BSTree< DataType, KeyType >::BSTreeNode](#)

### 4.3 config.h File Reference

## Defines

- `#define LAB9_TEST1 1`
- `#define LAB9_TEST2 1`
- `#define LAB9_TEST3 0`

### 4.3.1 Define Documentation

#### 4.3.1.1 `#define LAB9_TEST1 1`

`BSTree` class (Lab 9) configuration file. Activate test 'N' by defining the corresponding `LAB9_TESTN` to have the value 1. Deactive test 'N' by setting the value to 0.

#### 4.3.1.2 `#define LAB9_TEST2 1`

#### 4.3.1.3 `#define LAB9_TEST3 0`

## 4.4 database.cpp File Reference

```
#include <iostream> #include <fstream> #include "BSTree.-  
cpp"
```

## Classes

- struct `AccountRecord`
- struct `IndexEntry`

## Functions

- int `main` ()

## Variables

- const int `nameLength` = 11
- const long `bytesPerRecord` = 37

### 4.4.1 Function Documentation

#### 4.4.1.1 `int main ( )`

### 4.4.2 Variable Documentation

4.4.2.1 `const long bytesPerRecord = 37`

4.4.2.2 `const int nameLength = 11`

## 4.5 test9.cpp File Reference

```
#include <iostream> #include "BSTree.cpp" #include "config.-  
h"
```

### Classes

- class [TestData](#)

### Functions

- void [print\\_help](#) ()
- int [main](#) ()

#### 4.5.1 Function Documentation

4.5.1.1 `int main ( )`

4.5.1.2 `void print_help ( )`
